(I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; beabrands cell carcinoma; seborrheic wart; vitreoretinopathy; scar; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar;
                                                                                                                                                                                                                                                                              Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                            ribozyme (I) which cleaves RNA encoding a cytokine involved inflammation, matrix metalloproteinase (MMP), cyclin, cell-c dependent kinase, growth factor or a reductase, or administe
                                                                                                                                                          The present

The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, sclerostosis, osteomalacia and fibrous dysplasia.

ABAB2038 to ABAB2700 and AAG68168 to AAG68193 represent sequences used in the exemplification of the present invention

(I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarr. AAH57577 to AAH62099 represent sequences used in the

The present invention describes a compound (I) 8-50 nucleobases in length trargeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with and inhibits the expression of HSL or a splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding HSL. (I) have anorectic, antidiabetic and cytostatic activities, and can be used in antisense therapy. (I) is useful for treating an animal, particularly human, suspected of having an abnormal metabolic condition such is obesity, hyperilipidaemia, type 2 diabetes, a hyperproliferative disorder such as cancer (e.g. pituitary, colorectal, breast, testicular, pulmonary or epithelial cancer). (I) is also useful in modulating blood glucose levels, particularly plasma or serum glucose levels, in a diabetic animal. The present sequence represents a human hormone-sensitive lipase colimeric phosphorothicate antisense oligonucleotide, which is used in an examination of the represent exemption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           phosphorothioate; antidiabetic; anorectic; cytostatic; abnormal metabolic condition; hyperlipidaemia; type 2 hyperproliferative disorder; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-MAY-2003
                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides targeted against nucleic acids encoding hormone-sensitive lipase, useful for treating abnormal metabolic condition, e.g. hyperlipidemia and obesity, or a hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Insulin-secreting cell; pancreatic cell; islet duodenal horizon: jucagon-like peptide-1; GLP-1; insulin secretion; diabetes; PCR; primer; GLUT2; ss.
                                                                                                                                                                                                                                                                                               The specification describes an insulin-secreting cell, comprising a pancreatic cell transfected with islet duodenal homeobox-1 (IDX-1) cDNA and cultured in glucagon-like peptide-1 (GLP-1). The cell exhibits a dose dependent response of insulin secretion when exposed to glucose. The insulin-secreting cells and cell lines are useful for investigating the function and development of pancreatic cells, to test the efficacy of drugs that stimulate insulin secretion, or to develop new approaches to treat diabetes. PCR primers ABZ77624-25 were used to amplify a fragment of the GLUT2 gene. The primers were used to test the effect of GLP-1 on

                                                                                                                                                                                                                                                                                                                                                  junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine reducing file sense or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at figure at the printed specification, but was obtained in electronic format directly from WIPO at the printed specification.
                                                                                                                                              ABZ98862

                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition, which has a confirst active agent comprising an oligonucleotide antisense to the confirst active agent comprising an oligonucleotide antisense to the confirst active agent coding region, 5' or 3' end genomic flanking regions, confirst and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal atrway dysfunction and a second active agent comprising an attiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, have a use in antisense gene therapy. The composition is useful for treating or use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also composition generating the prophylatic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammatory gensitivity to adenosine, reducing or depleting levels of continuity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of beinguinone or lung surfactant in a subject stissue, or respiratory disease or condition.

Content the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO are ferrification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                         CC junctions of genes encoding a polypepide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, last immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of of adenosine receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or ferfine wire intending the produced or the printed continues of the printe

                                                                                                                                   Matches
                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of being increased.
                                                                                                                                                                                                                                                                                                                      lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                  Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel pharmaceutical composition, first active agent comprising an oligonucleotide antisense to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure;

                                                                                                                                                                                       The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC masal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubsquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or creventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject; stissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition, CC set from wino inflammation, but was obtained in electronic format directly from WIPO of a femination with mass obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABZ85442/c

                                                                                                                                                                                           The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding regions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                          initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dystunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing or depleting levels of, or reducing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of building inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                              junctions of genes encoding a polypeptide associated with lung and/or cases all airway dysfunction and a second active agant comprising an ansal airway dysfunction and a second active agant comprising an case antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a custom antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, or respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed as pecification, but was obtained in electronic format directly from WIPO

                                                                   ş
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC masal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammation, lung allergies, or treating bronchoconstriction, clung sufflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or at full print, wino, inhibitable for the sequence and the printed or t

                                                                                                                                                                                    The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition for the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of bulquinone or CC lung surfactant in a subject stissue, or treating bronchoconstriction, lung sulfalamation, lung allergies, or a respiratory disease or condition, CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or at ferm wino information and sequences.

                                                                                                                                                                                                     initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention and the invention and antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of demosine receptor, producing bronchodilation, increasing levels of adenosine lung surfactant in a subject's tissue, or respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention further relates to: an oligonucleotide containing single nucleotide colored from the combination of two DNA colored from any one of 1220 fully defined sequences as given in comparison; a labelling probe containing the SNP containing oligo; and microarray equipped with the SNP containing oligo. The isolated human colored gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents conce of the PCR primers used in the single nucleotide polymorphisms in a human gene. This polynucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                introducing a mutation in a gene involved in drug sensitivity of a shiitake mushroom. The gene involved in drug sensitivity of a shiitake mushroom encodes a succinate dehydrogenase Ip subunit, where the drug i carboxin. (I) is useful for providing resistance of shiitake mushroom against drugs e.g., carboxin. This sequence corresponds to a PCR primer used to amplify and mutate the genomic sequence for the succinate dehydrogenase Ip subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                    New drug resistant gene, obtained sensitivity of shiitake mushroom,

Accordingly, antisense oligonucleotides that inhibit the expression of ESR-alpha in cells or tissues can be used in gene therapy to treat conditions such as hyperproliferative disease, inflammation, tumour formation and to prevent or delay infection. As such, the present invention describes these antisense oligos as having cytostatic, antiinflammatory and antimicrobial activities. This oligonucleotide sequence is an antisense oligo used to inhibit expression of human oestrogen receptor alpha of the invention.
                                                                                                                                                                                                                                                                                                                                                               Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            important for bone maintenance and plays a protective role in the cardiovascular system, as well as being required for normal sexual maturation through promoting growth and differentiation. Splice variants of ESR-alpha, however, have been associated with various cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 3; Page 77; 232pp; English:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to nucleic acid encoding estrogen receptor alpha and inhibiting expression of estrogen receptor alpha, useful for treating a disease or condition e.g. a hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antimicrobial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel G-protein coupled receptors (GPCRs) and the nucleic acids encoding them. The invention is useful for treating viral, bacterial and fungal infections, inflammatory and neoplastic processes, pain, diabetes, hypertension, osteoporosis, cancer angina pectoris, myocardial infarction and atherosclerosis. The present sequence is G-protein coupled receptor (GPCR) related primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hypertension; osteoporosis; antibacterial; cytostatic; fungicide; pain; diabetes; cancer; virucide; analgesic; cardiant; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonuclectides. CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, IGFBP-8, Hcg24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, seleroderms and atherosclerosis. As
                                                                                                                                                                                                                                                                                                    such, the present invention describes these antisense oligos as having cytostatic, dermatclogical and antiarteriosclerotic activities. This oligonucleotide sequence is a chimeric phosphorothioate antisense oligowith 2' MOE wings and a deoxy gap, which is used to inhibit expression human CTGF of the invention.

New isolated polynucleotide encoding Zmsel polypeptide having a Cdc42/Rac interactive binding (CRIB) motif, useful for diagnosing and treating cancer and inflammatory conditions.

Example 4; Col 79-80; 55pp; English.

individuals at the Zmsel chromosomal locus. The Zmsel polypeptides are useful as research reagents and as an amino acid source for cell culture. The Zmsel present in heart and skeletal muscle are useful in promoting wound healing effects and exhibits anti-bacterial or anti-viral effects. The Zmsel polypeptides are useful for treating inflammatory conditions such as asthma, arthritis, diverticulitis. The Zmsel polypeptide is useful for treating treat inflammation. The Zmsel polypeptide is useful as an immunogen to elicit an immune response in an animal. The Zmsel polypeptide is useful as an immunogen to elicit an immune response present sequence represents a mouse Zmsel sequencing primer. The invention relates to an isolated polynucleotide encoding a Zmsel polypeptide. Cells expressing the nucleic acid are useful for producing polypeptides. The nucleic acid is useful as probes or primers to clone on coding regions of Zmsel gene. The nucleic acid is also useful for detecting allelic differences between diseased or non-diseased detecting allelic differences between diseased or non-diseased ñ,

Sequence 20 BP; თ A; 6 C; 7 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC transport Allease like protein polypeptide is also claimed. The method comprises culturing the host cell under conditions suitable for the comprises culturing the host cell under conditions suitable for the cexpression of the polypeptide, and recovering the polypeptide from the cc expression of the polypeptide from the cc mostropic, antiparkinsonian, cardiant, analgaesic, antiarrhythmic, conversive, nephrotropic, uropathic, cytostatic, vasotropic, and cc attivity. The polynucleotide may have a use in gene therapy. CC The polynucleotide and polypeptide are useful in identifying test compounds which may act as agonists or antagonists at the receptor site cc compounds which can be regulated to provide theraputic effects. The expression vector or reagent is useful in the preparation of a medicament for cc disease, e.g. a central nervous system (CNS) disorder, a cardiovascular cc (All claimed.) In particular, these diseases are Alzheimer's disease, cancer, a genitourinary disorder or a haematological disorder. (CAll claimed.) In particular, these diseases are Alzheimer's disease, conference, dementia, pain, congestive heart failure, myocardial infarction, ventricular arrhythmias, hypertension, renal failure, myocardial conference, etc. These are also useful for disgnosing, preventing or cc ameliorating the diseases. The present sequence represents a PCR primer cc used to amplify the human prolyl hydroxylase gene.
                                                                                                                                                                                                                                                                                                                              RESULT 1474
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

CC connective tissue growth factor (CTGF) by antisense oligonucleotides.

CC CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, consulin-like growth factor binding protein related protein 2, IGFBP-12, NOV2, consulin-like growth factor binding protein related protein 2, IGFBP-172, IGFBP-172, IGFBP-184, Hcs24 and ecogenin. It is known to stimulate DNA synthesis and CC promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides CC that inhibit the expression of CTGF in cells or tissues can be used in CC gene therapy to treat various conditions including hyperproliferative CC disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As CC such, the present invention describes these antisense oligos as having CC oligonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2 MCS wings and a deoxy gap, which is used to inhibit expression of contents of the invention of the contents of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense compounds, compositions and methods for modulating the expression of human farmesoid X receptor (FXR). FXR is also known as NRIH4, retinoid X receptor-interacting protein 14 (RIP14) and bile acid receptor (BAR). The antisense oligonucleotide is useful for inhibiting the expression of human FXR in cells or tissues. It is particularly useful for treating or preventing a disease or condition associated with FXR in a human, e.g. cardiovascular disease, atheroscierosis or hypercholesterolaemia. The antisense compound is useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. It is also used in gene therapy. The present sequence is an antisense oligonucleotide targetted to human FXR DNA. This sequence

The compounds of the invention are useful for preparing compositions for treating neurodegenerative diseases e.g. hyperproliferative or autoimmune disorders. The invention is also used in gene therapy. The present sequence is an antisense oligonucleoxide targetted to human PLSCR3 DNA

                                                                                                                                                                                                                                                                                                                                                                       Sequences ABZ74897-ABZ74942 represent antisense oligonucleotides targeted CC to the human or murine acyl coenzyme A cholesterol acyltransferase-1 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human or murine acyl coenzyme A cholesterol acyltransferase-1 RNA, and were analysed for their effect on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by contributive real-time PCR. Acyl coenzyme A cholesterol acyltransferase (ACAT) enzymes catalyse the synthesis of cholesterol acyltransferase cholesterol and fatty acyl-CoA, and are also involved in regulating the concentration of cellular free sterols. The murine acyl coenzyme A cholesterol acyltransferase-1 gene is located on chromosome 1. The chlesterol acyltransferase-1 gene is located on chromosome 1. The collesterol des of the invention are useful for the prevention and creatment of conditions associated with acyl coenzyme A cholesterol acyltransferase-1, such as disorders involving abnormal lipid or cholesterol metabolism, e.g., atherosclared for cardiovascular disease.
                                                                                                                                                                                                                                                                          Query Match

The method involves collecting data indicating chondrocyte cell viability for use in cartilage regeneration and providing a certification of chondrocyte cell viability including the data. The method is useful for certifying viability of chondrocyte cells for use in cartilage regeneration, particularly for autologous chondrocyte implantation. The method is useful for producing a quality assurance certificate for a given chondrocyte cell culture. It may also be used for determining the likelihood of hyaline cartilage regeneration in a patient with a cartilage defect. The invention is also useful for cell therapy. The present sequence is collagen II DNA specific RT-PCR primer used for the characterisation of chondrocytes. This sequence is used in the exemplification of the invention

The composition is considered osteopathic and a growth factor regulator and useful for treating osteogenesis, tenogenesis, chondrogenesis, bone, tendon and cartilage defect. The present invention relates to a primer selected from separate exons of interest and used during the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a compound (I) comprising 8-50 cnucleobases which is targeted to a 5 untranslated region (UTR), coding, coding, or the present invention of a nucleic acid molecule encoding phospholipase 3 UTRO or intron region of a nucleic acid molecule encoding phospholipase call group IIA (synovial), where the compound specifically hybridises with and inhibits the expression of phospholipase A2, group IIA (synovial). Calls odescribed: (1) a composition comprising the compound and a carrier or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with phospholipase A2, group IIA (synovial). (I) has antiinflammatory, antidiabetic, cytostatic and CC (synovial). (I) has antiinflammatory, antidiabetic, cytostatic and CC therapy. The compound (I) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial) chimeric phosphorthioate antisense oligonucleotide, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The method of the invention has thrombolytic and haemostatic civity. The methods and compositions of the present invention are useful for the diagnosis and treatment of, and/or analysing risks for thrombotic thrombocytopenic purpura. The present sequence is used in the exemplification of the invention

CC human CD40 ligand gene. The oligonuclectides contain either compounds of internucleotide bonds or have a pertide amide backbone replacing the usual phosphodiester contain phosphate backbone. The nucleotides flanking the central 10 cmucleotides have 2'-methoxyethyl nucleotides flanking the central 10 cmucleotides have 2'-methoxyethyl nucleotides (2'MOE wings) and the cytidine nucleotides are all 5-methylcytidines. The antisense compounds correctly accomplating the expression of CD40 ligand and for treating conditions associated with expression of CD40 ligand, e.g. condition arising from abstrant apoptosis. The antisense compounds are consisting are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent correctly infection, inflammation or tunor formation, as research reagents and tits, and in distinguishing between functions of various members of a cological pathway. Oligonucleotides ACC44014-ACC44011 represent the continense oligonucleotides of the invention to inhibit expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides targeted to nucleic acids encoding a CD40 ligand, useful in diagnostic and research applications, or for treating diseases associated with expression of CD40 ligand, e.g. cancer or autoimmune disorder.
                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel antisense oligonucleotide targeted to

                                                                                                                                       The invention describes a method for amplifying a nucleic acid fragment comprises using a non-cyclic single-stranded target nucleic acid as template and performing a strand displacement primer elongation reaction with use of a first primer having a sequence complementary to the target nucleic acid fragment to form a nucleic acid fragment. The method is for amplifying non-cyclic nucleic acid fragments, which is applicable in e.g. gene analysis, disease diagonats and identification of pathogenic microbes. The amplification can be efficiently performed. This sequence represents a primer associated with the non-cyclic nucleic acid amplification method described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                            Method for amplifying non-cyclic nucleic acid fragments with single-

The method is useful for identifying potential therapeutic, prophylactic and/or toxic agents for the treatment of diseases caused by an alteration in the expression profile of the transporter polynucleotides. PCR primers ABV71166-67 were used to amplify a non-conserved region of the rat GABA-1 transporter (GAT), designated 1-250. The amplified fragment was cloned, and used produce a transport array to demonstrate the method of the

The present invention describes a method for identifying a compound that induces senescence in a mammalian cell comprising culturing the cell in the presence and absence of the compound, assaying expression of at least one cellular gene (G1a) from 56 or a gene (G2) from 64 genes, with corresponding accession numbers given in the specification, and identifying compounds that induce senescence when expression of (G1a) or expression of (G2) is lower, in the presence of the compound. Also described: (1) a compound that induces senescence in a mammalian cell; (2) assessing efficacy of a treatment of a disease or condition relating to abnormal cell proliferation or neoplastic cell growth; (3) treating a disease or condition relating to abnormal cell proliferation or neoplastic cell growth; (4) identifying a compound that inhibits senescence-associated induction of cellular gene expression. The compound is useful for treatming or for assessing efficacy of treatment of a disease or condition relating to abnormal cell proliferation or neoplastic cell growth. The compound of the invention has a growth-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The method of the invention is useful for detecting an mRNA that is expressed in a species of Mycobacterium (e.g. Mycobacterium tuberculosis). The present DNA sequence represents a Mycobacterium specific nucleotide which can be used as a primer or probe in the method of the invention (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying a compound that induces senescence in a mammalian p53 deficient or tumor cell comprises assaying expression of cellular in the presence of the compound with expression of the genes in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21-DEC-2000; 2000US-0257907P.

                                                                                                                                                The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus neoformans, Candida albicans and infectious agents e.g. Cryptococcus neoformans, Candida albicans and aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Daracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obseity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          other growth-inhibitory primers which are used i
Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ligase detection reaction; LDR; p53; BKLAL; BROWN, ODESITY; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; oncogene; tumour suppressor; human papillomavirus; forensic; oncogene; tumour suppressor; human papillomavirus; forensic; oncogene; tumour suppressor; human papillomavirus; forensic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Capture oligonucleptide Zip ID#15 oligo #9.

                                                                                                                    The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for disgnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a mouse oligonucleotide relating to the TNFR1 of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 1457
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc inheritance. The 185 microsatellite markers of the invention are covered the control of developed from the ancestral diploid donor species Triticum tauschii and come appoint the wheat D genome, which is less polymorphic than the A or B cc genomes. These microsatellite markers thus help to overcome some of the problems associated with the genetic mapping of wheat. The wheat D genome cc map and the microsatellite markers and associated primers of the cc invention are useful for identifying genes responsible for a phenotypic trait of interest, most notably QTLs (quantitative trait loci). In cc particular they may be used for analysing genes and alleles implicated in cdisease and for identifying development factors, quality factors and cf factors conferring resistance to pathogens and xenobiotics. The cc mapping and genotyping diploid and polyploid species and triticum, cc particularly Aegilops, Triticum monococcum, Triticum durum, Triticum and related species; to assess whether or not a product comprises wheat or a related species; and to assess whether or not a product comprises wheat or a related species; and to assess whether or not a product comprises genetically claimed Triticum to assess whether or not a product comprises genetically claimed Triticum to assess whether or not a product comprises genetically claimed Triticum to used in corosatellite marker right pcR primer of the invention. (Updated on 29-cc AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of left (ABQ92918-ABQ93102) and right (ABQ93103-ABQ93287) primers to amplify and detect the microsatellite markers, and to identify genes responsible for a phenotypic trait of interest in wheat. Wheat is an allohexaploid species consisting of 3 diploid genomes designated A, B and D, resulting from two successive intercrossings involving at least three different species. The D genome is thought to have been introduced in the cost of the recent intercrossing, between the amphiploid AABB and Triticum trauschii (DD), probably involving only a limited number of genotypes of both species. Due to its polyploid genome, the large size of its genome, and its low level of polymorphism, the genetic mapping of wheat has to date been difficult. Microsatellites are tandemly repeated sequences between one and six nucleotides long, and are very polymorphic in length, comainly due to polymerase slippage during replication. This high degree of polymorphism makes them especially suitable for the genetic mapping of species which show little intraspecies polymorphism, such as wheat. In addition, microsatellites are codominant, and exhibit Mendelian are inhoritance who are interpolited to the propertion are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

The invention relates to a compound of 8-50 nucleobases in length CC targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where CC the compound specifically hybridises with and inhibits the expression of CC PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a CC compound of 8-50 nucleobases in length which specifically hybridises with a CC compound of 8-50 nucleobases in length which specifically hybridises with CC and B nucleobase portion of an active site on a nucleic acid encoding CC PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues CC comprising contacting the cells or tissues with the compound; treating an animal having or suspected of having a disease or condition associated CC with PTP1B in an animal comprising administering the compound; (5) CC preventing or delaying the onset of a disease or condition associated CC with PTP1B in an animal comprising administering the compound; and (6) CC with PTP1B in an animal comprising administering the compound; and (6) CC with PTP1B in an animal comprising administering the compound; and (6) CC prevent or delaying the onset of an increase in blood glucose levels in an animal comprising administering the compound. The compound is used CC in disable to a condition associated with CC prevent or delay the onset of a disease or condition associated with CC prevent or delay the onset of a disease or condition associated with CC animal having or suspected of having the disease or condition, and for CC cancer, chronic myeloid leukaemia and hyperproliferative diseases in an animal compound is also used in diagnostics, therapeutics, prophylaxis, and in research reagants and CC in diagnostics, therapeutics, prophylaxis, and in research reagants and CC targetting human PTP1B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compound for inhibiting the expression of protein phosphatase 1B (PTP1B) and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      associated with Lysophospholipase I e.g. inflammation, hyperlipidaemia, and cardiovascular disorders such as atherosclerosis and myocardial ischaemia. (I) is useful as research reagent and diagnostics. (I) is also useful for distinguishing functions of various members of a biological pathway. (I) is useful in antisense gene therapy. ABK37028-ABK37191 represent lysophospholipase I coding sequences, antisense oligonucleotides and related PCR primers of the invention. Note: Antisense oligonucleotides are modified such that bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides, all bases have phosphorothioate linkages, and all cytidines are 5-methyl cytidines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; G-protein coupled receptor; GPCRx11; cerebroprotective; vomiting; receptor-mediated disorder; therapy; urinary retention; allergy; obesity;

The present invention relates to a G-protein coupled receptor (GPCR) an nucleotide encoding it. GPCR are useful in the manufacture of a medicament for the prevention and/or treatment of receptor-mediated disorders e.g. viral infections, virus and bacterial diseases, diseases

The invention relates to a map of the bread wheat D genome location of a microsatellite marker selected such markers (ABQ92733-ABQ92917). The invention also

The antisense oligonucleotides can be used in a composition to modulate the expression of MEKK2 (AAV03598). The antisense oligonucleotides are useful for inhibiting the expression of MEKK2 in the treatment of immunological disorders, inflammatory disorders and hyperproliferative disorders e.g.

The invention relates to an isolated polypeptide, comprising a variant CCC form of mouse or human SAC1 polypeptide. The variant form is associated CCC with altered preference for carbohydrates, other sweeteners or ethanol. CCC The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or calcoholism associated with SAC1 expression. The sequences are useful in cor screening for drugs and sweeteners. Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce cor repress function of SAC1. Predisposition to diabetes, obesity or calcoholism can be ascertained by testing any fluid or tissue of a human ccc (such as blood, pancreas or tongue) for sequence variations of the SAC1 gene. A sequence variation of the SAC1 locus may indicate a consistion to diabetes, obesity and/or alcoholism and may provide a cc predisposition to diabetes, obesity and/or alcoholism and may provide a cc mapple by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and contracting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and contracting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and contracting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and contracting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and contracting the DNA with a probe to form a hybridisation complex which is then detected.

ISIS PHARM INC.

Bennett CF, Wyatt

Novel antisense compound useful for treating inflammation, hyperlipidemia, and cardiovascular disorders such as athemyocardial ischemia, inhibits Lysophospholipase I. atherosclerosis

and

3; Page 80; 131pp; English.

The invention where targeted to a nucleic acid molecule encoding lysophospholipase where (I) specifically hybridises with and inhibits the express:

(I) is useful for inhibiting the expression of (II) in cells in cells, and for treating a human having a disease or condition relates to an antisense compound (I) 8-30 nucleobases expression in cells or ij

Claim 14;

CC hNck-beta and Grb4), contains both SH2 and SH3 src homology domains and Cf functions as an adapter protein in integrin-mediated and receptor cyrosine kinase-mediated signal transduction, particularly in growth factor receptor signalling. Moreover, Nck-2 participates in pathways that connect growth factor receptor signalling and integrin signalling via its connect growth factor receptor signalling and integrin signalling via its connect growth factor, a LIM domain-containing adapter protein which is convolved in integrin, growth factor and Wnt signalling pathways. Nck-2 also interacts with EGF (epidermal growth factor) and PDGF (platelet derived growth factor) receptors, inhibiting EGF- and pDGF-stimulated DNA cynthesis in an SH2-dependent manner. Nck-2 is also able to interact with v-Abl, Ras and Sos proteins to induce transcriptional activation, and is therefore implicated in the development of cancer, particularly leukaemia cand breast cancer. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with Nck-2 expression, such as leukaemia and breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAC92649-C92728 represent antisense oligonucleotides targetted to the human Nck-2 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nck-2 mRNA; and were analysed for their effect on Nck-2 mRNA levels b
quantitative real-time PCR. Nck-2 (also known as Nck adapter protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length that are capable of inhibiting the expression of phosphoenol pyruvate carboxykinase-cycosolic (PEPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense compound capable of modulating the expression of pyruvate carboxykinase-cytosolic, useful for preventing or infection, inflammation or tumor formation.

The present invention relates to DNA and protein for zmsel, a novel human CC Cdc42/Rac interactive binding (CRIB) protein. CRIB proteins are CC implicated in human disease such as wiskott-Aldrich Syndrome. Zmsel CC modulators are useful for modulating tumour cell motility. invasion and CC metastasis, gene transcription, contractility of various tissues, actin CC polymerisation and cytoskeletal reorganisation, digestion, testicular CC function and fertility. Zmsel sequence and its modulators are useful for CC functing cancer, inflammatory heart or cardiovascular conditions, muscle inflammatory bowel diseases or diverticulitis, myocarditis, scleroderma, CC inflammatory bowel diseases or diverticulitis, myocarditis, scleroderma, CC inflammatory diseases, male infertility or as male contraceptive agents and for modulating spermatogenesis and sperm capacitation. zmsel and other CC and for modulating spermatogenesis and sperm capacitation. zmsel and anti CC zmsel antibodies are useful in diagnosing inflammatory diseases, such as reperfusion ischaemia, psoriasis, arthritis, melanoma and other conflammatory diseases, male reproductive cancers such as probes CC inflammatory diseases, male reproductive cancers such as probes CC inflammatory diseases, male reproductive cancers such as probes CC inflammatory diseases, male reproductive cancers such as probes CC is used in gene therapy. The present sequence is ZC19,270 primer used for sequencing mouse zmsel cDNA clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 4; Page 128; 132pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human CRIB protein, zmsel and polynucleotide encoding the protein, for detecting human chromosomal abnormalities and for treating cancer,
                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Holloway JL,

                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of 1 of 12 claimed antisense oligonucleotides (ASOs, see AAF90492-SO3) of the invention. These ASOs are complementary to regions of the human gene (see AAF90491) for the pro-alpha-1 chain of type I procollagen. They are capable of inhibiting the expression of type I procollagen pro-alpha-1 chain in a cell that expresses it. The ASO, or a pharmaceutical composition including it, is used in a claimed method of treating, or reducing a risk of, a collagen disorder. Such disorders may include those caused by overproduction of collagen fibres, such as liver cirrhosis, kidney, liver and heart fibrosis, scleroderma, hypertrophic sears and keloids. The present ASO, when administered to human WI-26 cells, inhibited type: I collagen

Also described are methods of using these compounds for the modulation of caspase 3 expression. The caspase 3 antisense oligonucleotides specifically hybridise with and inhibit the expression of caspase 3. Antisense compounds target to caspase 3 are useful to inhibit caspase 3 expression in cells or tissues and to modulate apoptosis. The caspase 3 antisense oligonucleotides are useful for treating disorders associated with expression of caspase 3. Such disorders include hyperproliferative disorders (e.g. cancer), viral infections (e.g. hepatitis), haematopoietic disorders, autoimmune disorders, atherosclerosis and neurological disorders (e.g. Alzheimer's

                                                                                                                                                                                                                                                                                                                                                              CC antisense oligonucleotides to nucleotide sequences encoding groß. More CC generally, antisense compounds (I) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groß! (heat CC shock protein (HSP)60) (GL) and groß (HSP)0) (GS) gene from a CC microorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises with and inhibits the CC expression of GL or GS, is claimed. (I) have antibacterial, antiviral and CC expression of GL or GS, is claimed. (I) have antibacterial, antiviral and CC expression of GL or GS, and can be used in antisense therapy and CC for inhibition of expression of großs or großl. (I) are useful for inhibiting the growth of a microorganism, or inhibiting the expression of GL or GS gene in a microorganism, or inhibiting CC the expression of GL or GS gene which involves administering to the CC microorganism or to a cell infected with the microorganism, (I). (I) are CS gene which involves administering to the CC microorganisms which involves identifying a cutaryotic organism or to a cell infected with the microorganism having a GL or GS gene and administering (I) such that the growth of microorganism is inhibited. The antisense compounds are utilised for diagnostics, to compound a pathological infections in humans. They are also useful as condition mediated by microorganism is consistent and condition mediated by microo

The antisense compounds are useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The antisense oligonucleotides are useful for treating an animal, particularly a human, suspected of having or being prone to a disease or condition associated with the expression of zinc finger protein-217. In particular, the antisense oligonucleotides are useful for preventing, delaying or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating the expression of zinc finger protein-217, particularly useful for preventing, delaying or treating infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           05-SEP-2001 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is one of a number of antisense compounds of 8 to 30 nucleobases in length that have been designed to target a 5'untranslated region, start codon, coding region or 3'untranslated region of the human receptor activator of NP-kappaB (RANK). The antisense compounds specifically hybridise with and inhibit the expression of RANK. The antisense oligonucleotides are useful for inhibiting the expression of human RANK in human cells or tissues. They can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of RANK, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, and as research reagent. The antisense compounds are safely and effectively administered to humans
                                                                                                           The present invention provides antisense oligonucleotides with phosphorothicate backbones directed at the human E2F transcription factor 3 (E2F-3) coding sequences. These can be used in the therapy of diseases which can be treated by modulating E2F-3 expression and to prevent infection, inflammation and tumour formation
                                                                                                                                                                                                                                    Novel antisense compounds targeted to E2F transcription factor 3 diagnosis, prophylaxis and treatment of diseases associated with transcription factor 3 such as infection, inflammation or tumor
                                                                                   Sequence
                                                                                                                                                                                              Example 15;

                                                                                                                                                                                                      The present invention describes an antisense compound (I) up to 30 nucleobases in length, where (I) inhibits expression of daxx (also known as Fas binding protein, CENP-C binding protein, dap6 for death associated protein 6 and EAP for Ets-1 associated protein). (I) has cytostatic and antiinflammatory activity, and can be used in antisense therapy and as a modulator of daxx. (I) is useful for inhibiting the expression of daxx in cells or tissues in vitro. (I) can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of daxx, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorothioate oligonucleotide which is used in the exemplification of the present invention

It is a scrambled sequence derived from oligonucleotide 13793 which is complementary to a portion of the start codon region (91-110) of human thymidylate synthase gene. It is capable of modulating the expression of thymidylate synthase by hybridising to the specific target region on the gene. This oligonucleotide inhibits cell proliferation when a therapeutically or prophylactically effective amount is administered. It can be used for diagnosis and treatment of hyperproliferative diseases like cancer and to distinguish thymidylate synthase-associated tumours from tumours having other etiologies in humans
                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20 BP; 1 A; 5 C; 13 G; 1 T; 0 U; 0 Other;

                                                                                                                                            oligonucleotides have a phosphorothicate backbone and the cytidine residues in the 2'-MOE wings are 5-methylcytidines. The fra-1 antisense oligonucleotides are useful for inhibiting the expression of fra-1 in human cells or tissues. They can be used for diagnostics, therapeutics, prophylaxis and as research reagents and in kits. Use of the antisense compounds may also be useful prophylactically, e.g. to prevent or delay
                                                                                                                                                                                                                                                                    The present sequence is one of a large number of antisense oligonucleotides which are targeted to nucleic acids encoding fra-1. The sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides, sequences may be oligodeoxyribonucleotides, on taking a central gap region consisting of ten 2'-deoxynucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel

                                                                                                                                                                                                                                                                                                                                                                                                                                    containing a mutant EphA4 gene. Targeted disruption of the EphA4 gene was achieved by homologous recombination in ES cells. The mutant allele should contain a neomycin-resistance gene within the EphA4 gene. The present sequence hybridises to exon III of the ephA4 gene. A 600 bp band is generated from the mutant allele whereas a 645 bp product is generated from the wild type allele. EphA4 deficient mice were used to show that increasing levels of the Eph receptor, or a ligand for the receptor, facilitates regeneration, growth and development of the central nervous system. Eph receptors or their ligands can be used to regulate axon guidance and to facilitate the repair or replacement of nervous tissue in an animal or bird in response brain or spinal cord injury or a disease of the upper motor neuron or central nervous system. Such disease include

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  is useful for the diagnosis of liver regeneration and/or liver cell proliferation. Anti-rap3 antibodies, PCR primers and nucleotide sequences which act as probes are useful for detecting the occurrence of liver cell proliferation in a patient. Single stranded oligonucleotides that are complementary to RAP3 can be used as probes to detect the amount of mRNA transcribed from RAP3 present in a sample such as a liver biopsy, plasma or serum of a tissue or body fluid in comparison to a reference sample. The probes can also be used for screening a liver CDNA or genomic library. The rap3 protein is useful for enhancing the growth or regeneration of liver tissue. The methods of invention can be used to establish the efficacy of therapeutic agents stimulating liver regeneration and for patients who have undergone liver transplantation and for monitoring patients treated with a bioartificial liver

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a PCR primer which is based on the rat RAP3 gene. The RAP3 gene and rap3 protein are involved in the regeneration processes of the liver, and the RAP3 gene is expressed specifically if the liver. The RAP3 gene is useful for designing PCR primers (such as present sequence) and probes for detecting nucleotide sequences in a source material and as a marker of liver proliferation. The rap3 prote
